The VivaScope systems are in-vivo confocal imaging tools that use a low-powered laser to provide non-invasive, real-time, high-resolution images of the epidermis and the superficial collagen layers. The system captures the natural reflectivity of different cellular structures that can offer important information that may be useful in forming a clinical judgment.

There are no other OEM’s providing this technology.

List the other vendors who were contacted. Please describe the specs/qualifications/criteria that the other vendors were unable to satisfy.
